

SIH25-806 • PPT Slide-by-Slide Winning Presentation Guide

Team Hexagram Master Strategy: How to Present & Win Smart India Hackathon

Problem Statement ID: SIH25-806 | **Ministry:** Ministry of Housing & Urban Affairs (MoHUA)

Team Name: Hexagram | **Team ID:** SIH2025-HEXAGRAM | **Team Members:** Sourav Kumar (Leader), Sumit Kumar, Rishabh Raj, Karishma Kumari Gupta, Abhas Prasad, Rishu Raj

1. The Judge's Mindset & Winning Pitch Blueprint

SIH Finalist & Senior Judge Insight:

"SIH evaluators grade over 20-30 presentations per panel. They don't just look for code—they evaluate **Problem Understanding, Technical Rigor, Real-World Feasibility, UI Polish, and MoHUA Policy Impact**. Your presentation deck SIH2026_Idea_Hexagram_DelhiEV.pptx has been structured to hit 100% of these criteria. This guide gives your team the exact slide-by-slide verbal script, visual cues, and defense strategies to dominate your presentation round."

2. Slide-by-Slide Master Script & Explanation Guide

Slide 1: Title Page & Team Credentials

Slide Objective: Establish instant authority, technical polish, and team identity.

Key Content on Slide: Problem ID SIH25-806, MoHUA Ministry Tag, Team Hexagram credentials, Team Member list, and Live Prototype Link.

Verbal Pitch Script (Speaker: Team Leader):

"Good morning honorable judges. We are Team Hexagram presenting our solution for SIH Problem Statement ID SIH25-806 under the Ministry of Housing and Urban Affairs: EV Charging Station Predictor — Optimal Site Recommendation Engine for Delhi NCT. Before we begin, our live production prototype is deployed and accessible at souravkr114.github.io/modified-sih-project/."

Judge Evaluation Focus: Verifies team registration details and immediate working prototype proof.

Slide 2: Proposed Solution (The 3 Innovation Pillars)

Slide Objective: Prove your solution is an intelligent decision engine, not just a static map.

Key Content on Slide: 3 Core Innovation Pillars (Multi-Factor GIS Scoring, SHAP Explainable AI, Investor ROI Simulator) + Dynamic Pincode/POI Engine.

Verbal Pitch Script:

"Judges, existing mapping tools show where chargers ALREADY exist. Our platform tells city planners and private operators WHERE THE NEXT CHARGER MUST BE BUILT. We achieve this through 3 core pillars: First, a Multi-Factor Spatial GIS Scoring Model evaluating demand gap, EV density, traffic corridors, and DISCOM grid capacity. Second, Explainable AI using SHAP feature attributions so planners see WHY a site received Rank #1. Third, an Investor Financial Simulator that calculates Capex, Opex, EBITDA, and Payback Period across interactive tariff sliders."

Judge Evaluation Focus: Differentiates your project from consumer maps like Google Maps.

Slide 3: Technical Approach & Production Architecture

Slide Objective: Demonstrate modern, type-safe full-stack software architecture.

Key Content on Slide: Next.js 16 (Turbopack), React 18, TypeScript, Tailwind CSS, Leaflet.js with CartoDB Voyager Light tiles, SHAP XAI engine, and 100% offline standalone resilience ('Delhi_EV_Platform.html').

Verbal Pitch Script:

"Our technology stack is built on Next.js 16 with Turbopack and TypeScript for high-performance spatial rendering. We utilize Leaflet.js for light vector tile GIS mapping and custom SVG candidate markers. Crucially, our architecture is 100% serverless on GitHub Pages and includes a zero-dependency offline standalone bundle ('Delhi_EV_Platform.html'), ensuring field resilience even without internet connectivity."

Judge Evaluation Focus: Technical stack maturity, execution speed, and offline reliability.

Slide 4: Feasibility, Grid Constraints & Data Quality

Slide Objective: Address real-world infrastructure constraints and data governance.

Key Content on Slide: Rule 2 Data Quality Compliance, Grid Substation Feasibility Index (11kV/33kV substations, cable distance in meters, transformer kVA), and Dynamic Supply Deficit adjustment.

Verbal Pitch Script:

"A high-demand site is useless if grid interconnection requires 5km of expensive cabling. Our Grid Feasibility Index evaluates distance to DISCOM 11kV/33kV substations and transformer kVA capacity directly in the site score. Furthermore, under Rule 2 Data Provenance, we combine ground-truth Delhi Govt Vahan registrations with OpenStreetMap GIS geometries and calibrated spatial proxies."

Judge Evaluation Focus: Real-world engineering feasibility, grid safety, and data credibility.

Slide 5: Impact, Benefits & MoHUA Policy Alignment

Slide Objective: Prove policy impact and economic viability for city authorities & CPOs.

Key Content on Slide: Direct alignment with MoHUA urban benchmark of 1 Public Charger per 25 EVs, economic de-risking (14–24 month payback), and multi-modal transit integration (ISBTs, Metro, Airport).

Verbal Pitch Script:

"Our platform directly operationalizes MoHUA urban guidelines targeting 1 public charger per 25 EVs. By incorporating our District Deficit Matrix, city authorities can identify deficit hot-spots like North Delhi (773.6 EVs/charger), while private CPOs can de-risk capital investments by predicting payback periods before breaking ground."

Judge Evaluation Focus: Government policy alignment, public impact, and financial de-risking.

Slide 6: Demo Links, Code Repository & References

Slide Objective: Close with authority and invite judges to test the live prototype.

Key Content on Slide: Live Prototype URL, GitHub Repository, Delhi EV Policy 2026, and OpenStreetMap references.

Verbal Pitch Script:

"In conclusion, Team Hexagram has delivered a production-ready, fully deployed decision support platform for MoHUA. You can test the live application right now on your devices at souravkr114.github.io/modified-sih-project/. Thank you, and we welcome your questions!"

Judge Evaluation Focus: Complete deployment verification and transition to Q&A; round.

3. Q&A; Defense Strategy (Winning the 5-Minute Evaluation)

Judge Question Scenario	Winning Defense Strategy & Formula to Quote
1. 'Is your ML model actually running or is it static?'	Demonstrate clicking 'Predict Station Site', change Pincode (e.g. 110019) or POIs, and click Predict. Show instant live recalculation of map pins, candidate scores, daily sessions, and SHAP feature drivers.
2. 'How do you calculate the site score mathematically?'	Quote the formula: $S_i = \min(100, \sum w_k \cdot f_{ik})$ across 6 factors: Demand (30%), Supply Deficit (20%), Grid Capacity (15%), District Fleet (15%), Traffic (10%), and POI Dwell (10%).
3. 'What is SHAP and why did you use it?'	Quote SHAP additive equation: $S_i = E[f(x)] + \sum \phi_k$. Explain that SHAP eliminates 'black box' opacity by providing additive game-theoretic weights (+24.5 traffic, +21.0 supply gap).
4. 'How does this align with MoHUA policy?'	Point to the District Deficit Matrix in the app. State that MoHUA targets 1 public charger per 25 EVs , and our platform highlights districts like North Delhi (773.6 EVs/charger) as high-priority target zones.
5. 'What happens if internet fails during field deployment?'	Explain that our platform includes a 100% offline standalone single-file bundle (Delhi_EV_Platform.html) running client-side Babel & Leaflet JS with zero server dependencies.
